

TUTORIAL 2.3

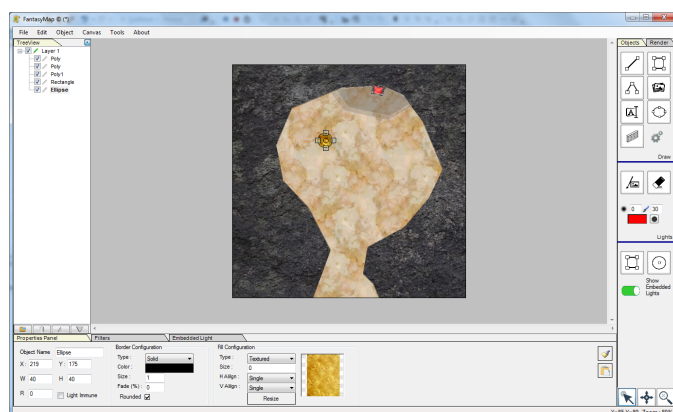

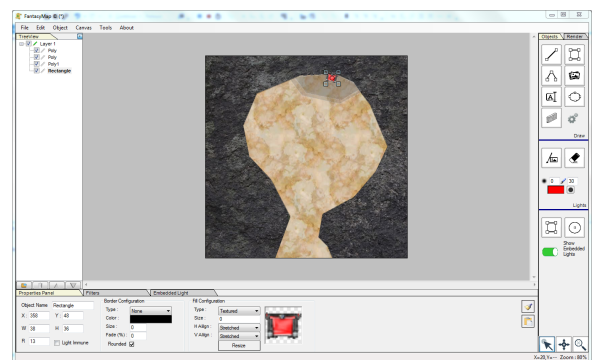

OBJECT GROUPING AND ALIGNING

In this tutorial we will briefly explain how align objects each other and group them in a singular object (group).

First of all, create a new map as seen on previous tutorials: Use some polygon to draw a marble cavern inside a mountain, and add a couple of steps leading to an upper throne area. Then you decide you want to add six column, three each side of the cavern.

Probably columns will put some more difficulties in the final boss battle you're planning to propose in this area...

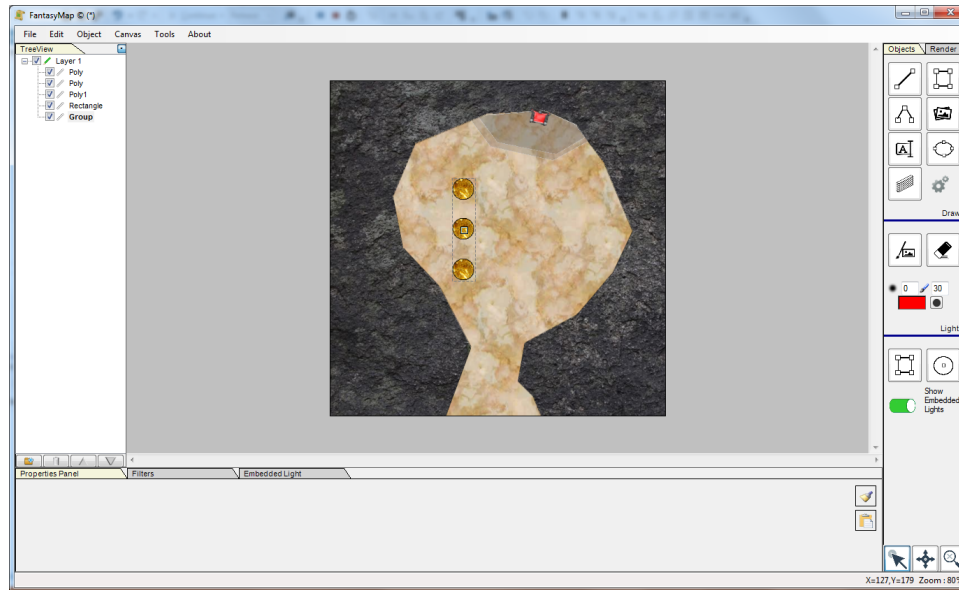

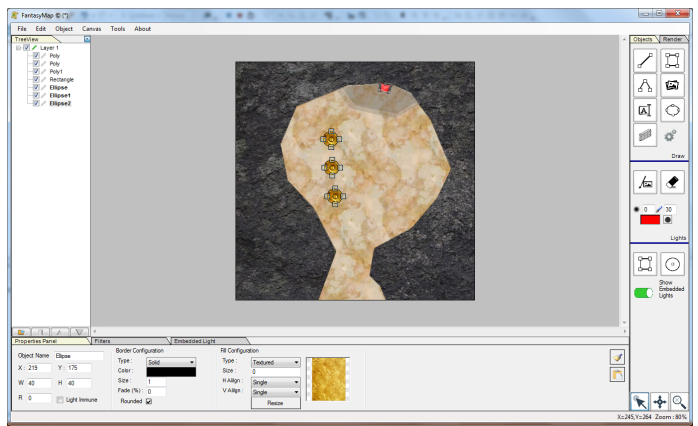

Draw a circular ellipse (well, draw an ellipse. Probably you'll not be able to make a perfect circle, so change width or height in order to have the same number there...) and fill it with a gold texture.

Yes. Golden columns, in a cave. Why not?

Copy/Paste (CTRL+C / CTRL+V) the column for other two copies. dispose vertically at your choice, then select all three simply keeping CTRL key pressed while clicking on each column.

Navigate into the *Object - Align* menu and choose left. All three object will be aligned to the left.

Now navigate through the *Object* menu and select the *Group* command.

All three objects will be grouped in one.

Copy the group (CTRL-C / CTRL-V) to make the left side columns. drag the new group into the required position.
